

Raw Material

Train running on up-hill
(when train run on uphill it
convert the electrical energy
into potential energy)

Large solar power plant

Raw material
(Extracted from mine)

Running train down-hill
to generate electricity
to run water pump

Copper mine

External water pump
to remove waste from
Copper mine

Using train Based System to transport the Raw material
(in the place of truck) and also using train to store
excess electrical energy produce by the solar panel and
using it to run the water pump in Night time
